

NAVIGATION BAR WITH DROPDOWN

BY:V.MAHARANI
I BCA-A

INTRODUCTION

A navigation bar is used to navigate between web pages.

Dropdown menus display additional links inside the main menu.

This project is created using HTML and CSS only.

It improves website structure and user experience.

HTML STRUCTURE

`<nav>` tag defines the navigation section

`<ul>` creates an unordered list for menu items.

`<li>` represents each menu option.

Nested `<ul>` is used for dropdown items.

CSS DESIGN

Background color set using background-color.

display: inline-block creates horizontal menu.

position: relative and absolute used for dropdown placement

text-decoration: none removes underline from links.

DROPDOWN FUNCTIONALITY

Dropdown content is hidden using `display: none`.

`:hover` selector is used to show dropdown menu.

`.dropdown:hover .dropdown-content` makes it visible.

No JavaScript is required.

CONCLUSION

Simple and clean navigation design.

Easy to customize and modify.

Lightweight and fast loading.

Suitable for basic websites and student projects.

The background features abstract geometric patterns in teal. In the top-left and bottom-left corners, there are nested rectangular outlines. In the top-right and bottom-right corners, there are clusters of small teal circles arranged in a grid-like pattern. A diagonal teal line runs from the top-left towards the bottom-right, intersecting the other elements.
